I am sure you saw this in the State's comments but just in case.

The permitted NO_x performance level of Naughton Unit 3 after conversion to natural gas is 0.08 lb/MMBtu based on a 30-day rolling average and not 0.10 lb/MMBtu based on a 30-day rolling average as stated in PacifiCorp's permit application. Additionally, the permitted NO_x mass emission rate is 250 lb/hr based on a 30-day rolling average, which is protective of visibility and lower than the BART-determined NO_x rate of 259 lb/hr based on the same averaging period. Finally, annual NO_x emissions will be reduced from the BART level of 1,134 tons to 519 tons.
